Challenge Name: Audit Log

Category: MISC

Description:

Our auditor went through every line, but we lost the results of their investigation. Can you check the digits and see what they flagged as suspicious?

Hint(s):

None

Walkthrough:

The challenge gives a long list of 136 16 digit numbers, with leading 0s not cut off. This is notable because the description also mentions to “check the digits”, pointing towards a check digit algorithm. Since each number is 16 digits, they look pretty similar to credit card numbers which use the Luhn Algorithm as the check digit formula.

Creating a program to check what passes the luhn algorithm and encoding it as a 0, while the ones that fail are marked with a 1 will form a binary string. Decoding this string will result in the ASCII string “d3cl1n3d_4ppr0v3d” which is the flag for this challenge.

Flag:

RCCTF{d3cl1n3d_4ppr0v3d} - case insensitive
