The Impossible Security+ Quiz

Misc / Logic · Hard–Very Hard

Description	Your Security+ exam has been replaced by SY0-NOPE. The proctor is a goose. The biscuits are classified. The accreditation is questionable. Pass twenty questions and convince the exam board that you are provisionally employable. You have three lives. The goose has tenure.
Files	The player opens the hosted quiz; there is no player download. Deploy challenge/ with Docker Compose. Keep this document and organizer/ private. From this challenge's `challenge` directory: `docker compose --env-file ../organizer/event.env up --build -d` Open `http://localhost:18115`. The private event.env supplies the fixed flag. For an event hostname, set `PUBLIC_ORIGIN` to that exact origin; set `COOKIE_SECURE=true` behind HTTPS. SQLite persists sessions in the `quiz-data` volume. Stop this deployment with `docker compose down`; retaining the volume preserves player progress and certificates. Each browser cookie identifies a separate session. Deploy only the application image, never the whole challenge folder as a web root. Original effects, music, and reference artwork are frozen locally. Their provenance and unresolved redistribution permissions are recorded in asset-manifest.json. This package does not establish permission to redistribute third-party music.
Hint(s)	None
Walkthrough	The exam rewards checking the evidence behind a label. Early questions introduce physical boundaries, exact permissions, a photographed strip, trust rules, and clock corrections. Later questions combine those observations into one final audit. Every necessary technical rule appears in the quiz. Click **START**. Inspect and change drafts freely; **ANSWER** submits them. A wrong answer normally costs one of three lives. Question 16 warns that detonating its circuit ends the entire attempt. Save the skips earned at questions 5, 10, and 15. Spending one scouts ahead but requires a fresh attempt before certification. **NOTES** retains evidence and personal

notes across deaths; **DOWNLOAD NOTES** saves a text copy. Reload and **RESUME** recover the current attempt.

1. **AUTHORIZE THE ANSWER.** Only words outside a box may be authorized. The four pink boxes fail that rule. Select **THE ANSWER** within the question heading, then press **ANSWER**.

2. **Patch the critical vulnerability.** Biscuits fall through the tear in the goose's trousers. Drag **CLOTH PATCH** onto the goose, or select the patch and activate **Torn trouser seam** with the keyboard. The patch stops the leak. Submit the patched state.

3. **Your password must be eight ticks long.** Measure the drawing. Stretch its right handle until PASSWORD spans at least eight ruler intervals. The **Stretch handle** slider also works with arrow keys. Submit a width of eight or more.

4. **Two factors, please.** The categories distinguish remembering something, carrying something, and a live physical characteristic. PIN and password are both KNOW. Choose any two cards from different categories, such as **PASSWORD** and **SECURITY KEY**, then submit. A security key and live wingprint also qualify.

5. **Put ONLY the ducks inside the firewall.** Both left pictures are ducks despite their captions. Move and resize the pink boundary to contain both and exclude the brick and

laptop on the right. Arrow keys move the focused boundary; Shift plus arrows resize it. Submit and keep the first skip.

6. **Air-gap the vault.** V has two routes to the public network: A–V and B–V. Cut both using the cables or their buttons. Keep I–A, I–B, A–B, and V–L connected. This isolates V and its printer L while preserving the public soup network.

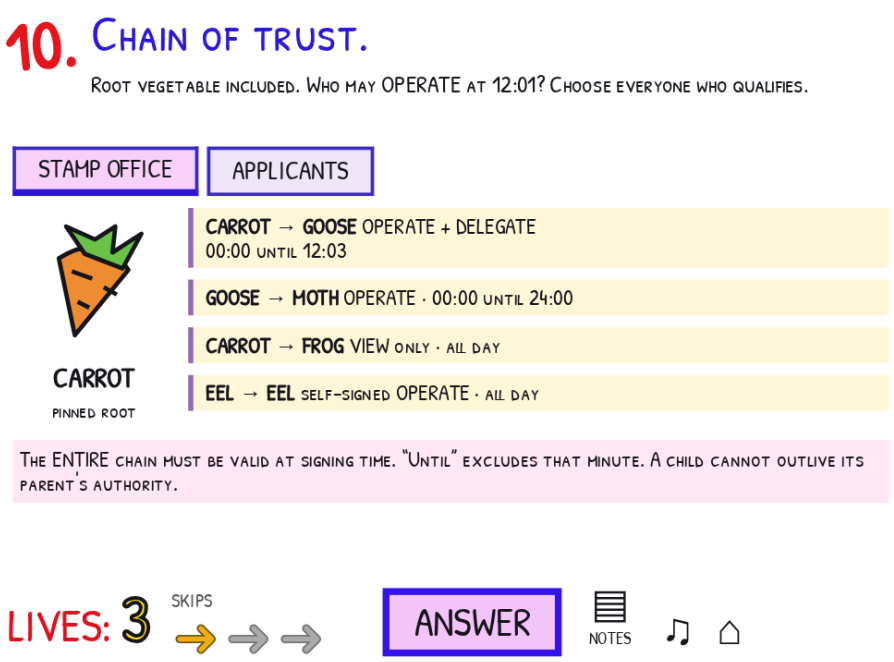

7. **The intern requested EVERYTHING.** The job needs only READ. Toggle PRINT, APPROVE, and SHRED off, leaving READ enabled. A useful-sounding permission is still excessive when the job does not require it.

8. **Find the false positive.** Hover or focus each bag to inspect its contents. A false positive is an alarm on something the policy permits. Bag 3 contains a rubber duck and raises an alarm. Select it, confirm its selected state, and submit. The knife without an alarm is a false negative.

9. **Back up the original. Not the mistake.** The intake photograph shows A B C D, all faces up. Use **MOVE PAPER** and, if helpful, **DIRECTION** to bring that actual strip into the capture window. Press **COPY**. The photograph remains in the notebook. Conveyor direction changes movement, not the order of printed symbols.

10. **Chain of trust.** Read **STAMP OFFICE**, then open **APPLICANTS**. At 12:01, Carrot's grant to Goose has not expired, and Goose may delegate OPERATE to Moth. Frog has

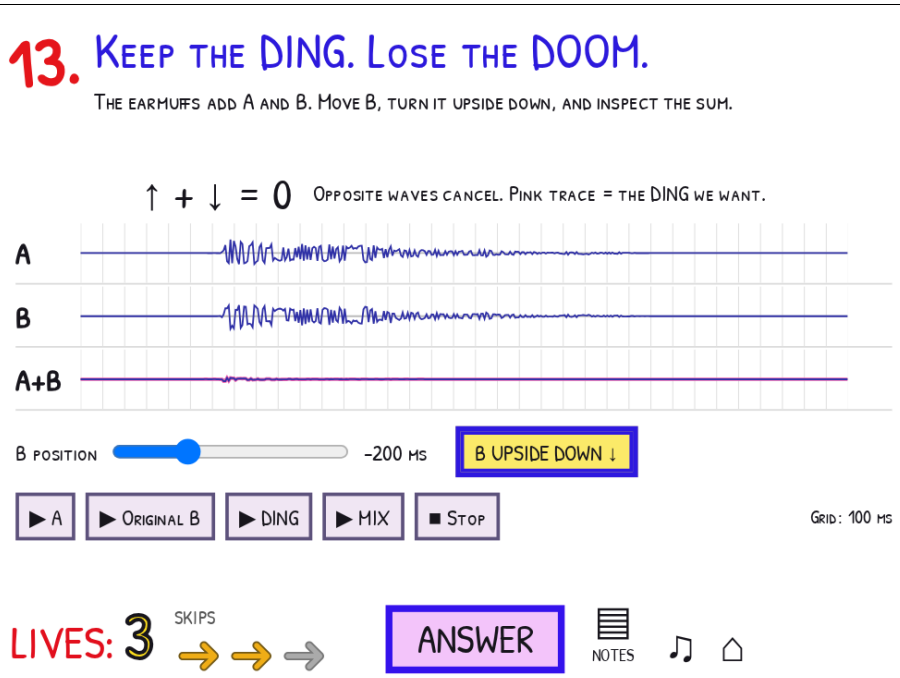

only VIEW; Eel has no path to the pinned root. Select Goose and Moth. **TEST SELECTED STAMPS · FREE** demonstrates the policy without costing a life. Submit and retain the second skip.

11. **No tailgating.** Use **Add action** to draft: Open outer → Goose enters vestibule → Close outer → Open inner → Goose enters room → Close inner. **REHEARSE · FREE** shows the simulated result. Only the authorized goose enters, the follower stays outside, and both doors end closed. Submit. Equivalent safe sequences are accepted.

12. **The clocks have unionized.** The same noon bell reads BOARD 12:04 and PRINTER 11:57. Subtract four minutes from BOARD and add three to PRINTER. The panels occurred at BACKUP 12:00, ISSUE 12:01, APPROVE 12:02, and EXPIRE 12:03. Select those panels in that order. Clicking a selected step removes it; **Clear plan** starts the draft again.

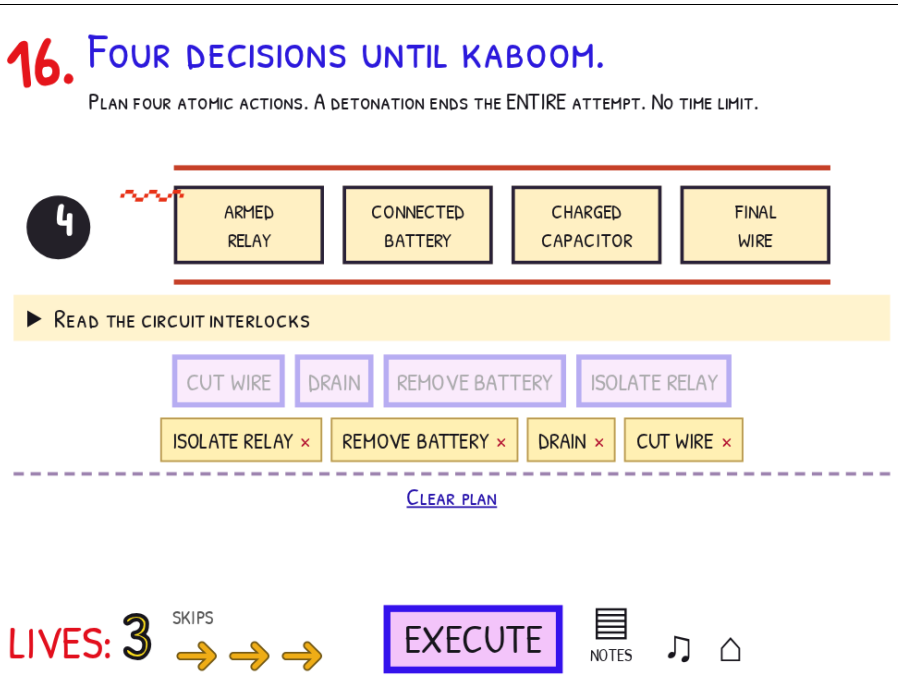

13. **Keep the DING. Lose the DOOM.** A contains noise plus the desired signal. B contains the same noise delayed 200 ms. Set **B position** to **−200 ms**, then choose **B UPSIDE DOWN**. Aligned negative noise cancels the noise in A; A+B matches the pink reference. **MIX** plays the actual computed samples. Submit. The waveform and 100 ms grid provide equivalent evidence while muted.

14. **The checksum is an idiot.** Every choice totals ten under the stated addition rule. That says nothing about order. Open **NOTES** and compare question 9's original photograph. Select **ABCD** and submit.

15. **Audit the auditor.** Stamp A and B TRUE, C and D FALSE. A agrees that B is true; B agrees that C is false. A and D differ, making C false. Exactly two of A, B, and C are true, making D false. All four stamps agree with their claims. Submit and retain the third skip.

16. **Four decisions until kaboom.** Read the circuit interlocks before committing. Removing power while the relay is armed detonates; draining a connected capacitor recharges it; battery removal does not remove stored charge. Draft **ISOLATE RELAY → REMOVE BATTERY → DRAIN → CUT WIRE**. Then press **EXECUTE**. There is no timer; editing the four-step plan is free.

17. **Put NOT where it belongs.** The cards require denying only the round-and-striped object. Choose **NOT (ROUND AND STRIPED)**. The negation covers the whole conjunction, so anything missing either property is allowed. Confirm that all four computed examples match their wanted outcomes, then submit.

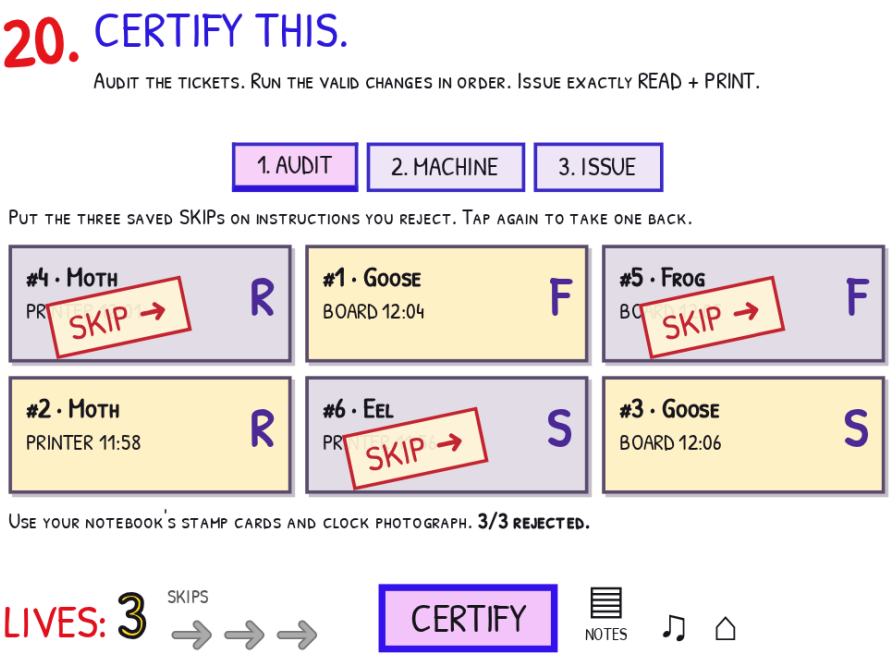

18. **Backwards is not the same as undone.** From C− B+ D+ A+, **F · FLIP FIRST** restores C's face; **S · SWAP FIRST TWO** makes B+ C+ D+ A+; **R← · LAST TO FRONT** restores A+ B+ C+ D+. Submit. **Undo last experiment** and **Reset machine** allow free exploration. Any sequence restoring every identity and face is valid.

19. **One change label was forged.** The first photograph moves A to the end, matching R. The second swaps B and C, matching S. The third preserves the order and flips C's face, so its label must be F. Set **Change label 3** to **F · FLIP FIRST**, keeping R and S for the first two. Submit.

20. **CERTIFY THIS.** Work through three views of one board. Drafts remain when switching views. The notebook retains the stamp policy, clock calibration, and machine rules.

In **1. AUDIT**, correct every signing time and check the complete authority chain. Ticket 1 is Goose at 12:00; ticket 2 is Moth at 12:01; ticket 3 is Goose at 12:02. These carry valid OPERATE authority. Put skips on **4, 5, and 6**: Moth's

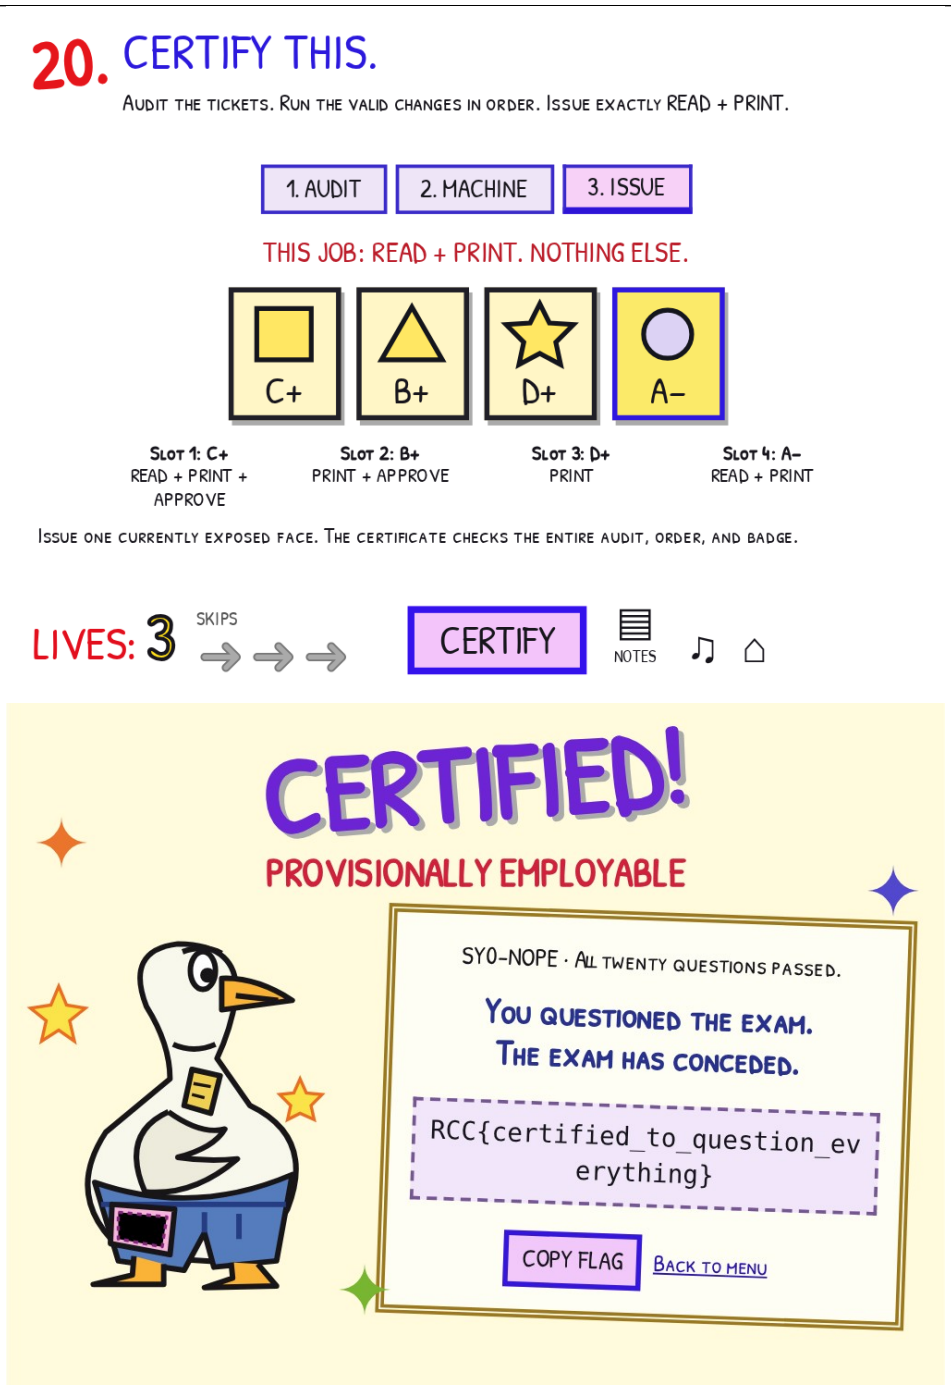

ancestor has expired by ticket 4's corrected 12:04; Frog has only VIEW on ticket 5; Eel has no trusted root on ticket 6. Tap a ticket again to remove its skip.

In **2. MACHINE**, choose valid tickets **1 → 2 → 3** in corrected chronological order. Their F, R, S transformations produce:

```
A+ B+ C+ D+
A− B+ C+ D+    F: flip first
B+ C+ D+ A−    R: move first to end
C+ B+ D+ A−    S: swap first two
```

In **3. ISSUE**, compare only exposed faces. Slot 1, C+, includes APPROVE; slot 2, B+, includes APPROVE and lacks READ; slot 3, D+, lacks READ. **Slot 4, A−**, grants exactly READ and PRINT. Select it and press **CERTIFY**. Success consumes all three skips atomically and reveals the flag. **COPY FLAG** copies it; the menu's **Your certificate** recovers it later.
